

Embroidering and Braid-Making Machine.

The adjoined engraving represents a very ingenious and useful attachment to the sewing-machine, which does not occupy much more space than the ordinary pressure foot. In order to attach it the latter is removed, and the embroidery attachment derives its action from the needle-bar, becoming in its turn a pressure foot, without interfering with the working of the needle, which will do ordinary sewing as well with this attachment as with the regular pressure foot. When the attachment is operated, all that is necessary is to add to the ordinary sewing-thread another thick thread or cord, of any desired quality or color; then the machine will make the braid from it, and the machine-needle will fasten it to the stuff at one operation. A spool of 200 yards of thread will make 86 yards of finished braid or embroidery, which may be varied

in quality and color, according to taste, and even shading may be introduced by working more than one thread at the same time.

At present these little machines, which are called, after the inventor, the Rose attachment, can be obtained adapted for the Singer, the Wheeler & Wilson, the Howe, the Home and Weed machines, but can be made for any machine for which there is a sufficient sale.

The well-known house of Holmes, Booth & Hayden, of Chambers street, New York, has accepted the business management for the sale of this contrivance, which costs only \$1.50; wherefore we anticipate a large sale, especially in view of the beautiful specimens of embroidery on cloth and other materials which have been brought to our office for inspection.
